## (54) TACKY ADHESIVE COMPOSITION AND POULTICE

### (57)Abstract:

**PROBLEM TO BE SOLVED:** To provide a tacky adhesive composition having a gel strength optimum for the spreading work at the end of kneading and the end of the spreading on a substrate, having optimum elasticity after the formation of cross-linked structure and moderately adhering to the skin and to provide a poultice provided with the composition.

**SOLUTION:** This tacky adhesive composition contains a water-based tacky adhesive base containing a water-soluble polymeric material, a metal cross-linking agent for forming a cross-linked structure of the water-soluble polymeric material and an amino acid and/or a compound of the metal cross-linking agent and an amino acid as essential components. The gel strength of the composition is 2-15 mm at the end of the kneading of the essential components with other components containing solvent and at the end of the spreading of the composition on a substrate and the elastic modulus of the composition is 50-400 g/cm<sup>2</sup> after the formation of the cross-linked structure. The poultice is produced by spreading the tacky adhesive composition on an substrate.
